Summary of potential impacts of the May 2009 MPA proposals (Round 2) on commercial and recreational fisheries in the South Coast Study Region

Draft 17 June 2009

Astrid Scholz, ajscholz@ecotrust.org, Sarah Kruse, Charles Steinback, Jon Bonkoski and Sonya Hetrick

1. Introduction

The purpose of this project is to analyze the relative effects of six MPA proposals on commercial and recreational fisheries in the South Coast Study Region (SCSR). For detailed information on how data were collected and/or analyzed, please see our *Draft Survey Methods and Summary Statistics for Ecotrust's South Coast Study Region Fishery Uses and Values Project* (presented to the RSG on 3/3/2009). For information on the methods used to evaluate these data, please see Section 12 of the *SAT Draft Methods Used to Evaluate Marine Protected Area Proposals for the MLPA South Coast Region*. Additional proposal-specific information on potential fishery-specific impacts (to study region and to total area and value) for any given MPA are available in the series of Excel files provided to the RSG.

To analyze the commercial fisheries, we used data layers characterizing the spatial extent and relative importance of fishing grounds for 15 commercial fisheries. We collected this information during the summer and fall of 2008 using a stratified, representative sample of 254 commercial fishermen. Individual responses regarding the relative importance of ocean areas for each fishery were standardized using a 100-point scale and normalized to the reported fishing grounds.

To analyze the recreational fisheries, we used data layers characterizing the spatial extent and relative importance of fishing grounds for 10 commercial passenger fishing vessel (CPFV) fisheries and 17 recreational fisheries. We collected this information during the summer and fall of 2008 using a stratified, solicited sample of 119 CPFV and 504 recreational fishermen. Individual responses regarding the relative importance of ocean areas for each fishery were standardized using a 100-point scale and normalized to the reported fishing grounds.

Based on the data described above, we evaluate the potential economic impacts on the commercial, CPFV, and recreational fishing grounds under each of the six MPA proposals (i.e., Lapis 1, Lapis 2, Opal, Topaz, Ext. A, and Ext. B). We also conduct a socioeconomic impact analysis on the commercial and CPFV fisheries. We report commercial and CPFV results by by port. We report recreational results by user group (i.e., dive, kayak, and private vessel) and by county.

The remaining sections of this document summarize the potential impacts. For more detailed statistics, please see the tables in the Appendix.

In all tables presented, a 'dashed line' represents a fishery that does not occur or a fishery for which insufficient data were collected to merit presentation.

¹ The use of a solicited sample may cause traditional statistical measures (e.g., confidence intervals) to be less precise. Nevertheless, it does allow us to make generalizations about preferences of the overall recreational fishing population and about the three user groups within the study area. We feel that this adds thematic resolution to the MLPA marine planning process.

2. Impact of the Channel Islands MPAs (C.I. MPAs)

This report also presents the potential impacts of the Channel Island MPAs on commercial, CPFV, and recreational fishing grounds. We calculate these impacts the same way that we calculate the impacts of each MPA proposal (as described in the Introduction).

The Channel Islands network, which was established by California Fish and Game Commission (CFGC) in 2002 and expanded by the National Oceanic and Atmospheric Administration (NOAA) in 2006 and 2007, encompasses 241 square nautical miles (or 318 square miles). It consists of 11 marine reserves where all harvest and take is prohibited (Richardson Rock, Harris Point, Carrington Point, Scorpion, Anacapa Island, Footprint, Gulf Island, Skunk Point, South Point, Judith Rock, and Santa Barbara Island) and two marine conservation areas that allow limited take of lobster and/or pelagic fish (Painted Cave and Anacapa Island). The Channel Islands network was originally set to be reconsidered during the marine planning process (i.e., stakeholders would be given the opportunity to propose changes to the siting of the existing MPAs), and it was later decided that the Channel Islands MPAs would not be changed.

Therefore, because all proposal must include the Channel Island MPAs, the potential impacts of the Channel Islands (C.I.) MPAs will be the <u>same</u> under all the alternative MPA proposals and any comparison of the proposals should separate out these impacts.

By subtracting the estimated C.I. MPAs impacts from the estimated total impacts, stakeholders can more easily assess the potential impacts of MPAs that can be changed. For example, if the total impact of a MPA proposal is a 19% reduction in net economic revenue, but 5% of this reduction comes from the Channel Island MPAs, then stakeholders can only potentially affect 14% of the impact (i.e., the minimum impact of their proposal is a 5% reduction in net economic revenue assuming zero impact elsewhere in the SCSR).

3. Results for Commercial Fisheries

We summarize here our analyses of the potential impacts on the 15 commercial fisheries (i.e., Ca. Halibut (Hook & Line), Ca. Halibut (Trawl), Coastal Pelagics, Lobster, N. Fishery (Hook & Line), N. Fishery (Trap), Rock Crab, Sablefish, Sea Cucumber (Diving), Sea Cucumber (Trawl), Spot Prawn, Squid, Swordfish, Thornyhead, and Urchin). The commercial fisheries are are reported for the entire study region and by port (i.e., Santa Barbara, Ventura, Port Hueneme, San Pedro, Dana Point, Oceanside, and San Diego).

3.1 Potential Impacts on Commercial Fishing Grounds (Area and Value)

MPA proposals vary considerably in their effects, both between and across fisheries. As mentioned previously, this report only presents results. Evaluation methods are presented in a separate document.

Each proposal affects the commercial fisheries differently. Ext. A generally has the lowest potential impacts in terms of both total value and total area, while Ext. B generally has the highest potential impacts. For information on the potential impacts on commercial fishing grounds for the 65 port-fishery combinations considered (both in terms of total area and total value), please see Tables A.1 and A.2 in the Appendix.

3.2 Potential Net Economic Impacts on Commercial Fisheries

A key assumption of this analysis is that each of the MPA proposals completely eliminates fishing opportunities in areas closed to specific fisheries and that fishermen are unable to adjust or mitigate in any way. In other words, the analysis assumes that all fishing in an area affected by an MPA is lost completely, when in reality it is more likely that fishermen will shift their efforts areas outside the MPA. The effect of such an assumption is most likely an overestimation of the impacts, or a "worst case scenario."

Table 1 summarizes the MPA proposals with the estimated highest and lowest potential net economic impact by port (for associated values, see Table 2). On average, Ext. A is estimated to have the lowest potential net economic impact across the study region, while Ext. B is estimated to have the highest potential impact.

Figure 1 summarizes the potential annual net economic impact on SCSR commercial fisheries considered, calculated as a percentage reduction in net economic revenue (i.e., profit). The potential impacts from each proposal are further broken down by port in Figure 2 and Table 2. On average, Santa Barbara is the port estimated to see the lowest potential net economic impacts (as a %), while Oceanside is estimated to see the highest potential net impacts (as a %). Tables 3–10 show potential impacts by fishery for each port and for the SCSR.²

In terms of <u>potential net economic impact</u> across the SCSR for the top six commercial species (based on % contribution to overall SCSR ex-vessel values), several patterns emerge from the analysis of the six proposals:

- The rock crab fishery sees the lowest range of potential impacts (in dollars). Topaz has the highest potential impact on the rock crab fishery (\$91,869), while Ext. B has the lowest potential impact (\$63,073).
- The squid fishery sees the highest range of potential impacts (in dollars). Ext. B has the highest potential impact on the squid fishery (\$3,042,408), while Ext. A has the lowest potential impact (\$702,287).
- The rock crab fishery sees the lowest range of potential impacts (as a %). Topaz has the highest potential impact on the rock crab fishery (11.8%), while Ext. B has the lowest potential impact (8.1%).
- The spot prawn fishery sees the highest range of potential impacts (as a %). Ext. B has the highest potential impact on the spot prawn fishery (42.9%), while Ext. A has the lowest potential impact (17.0%).

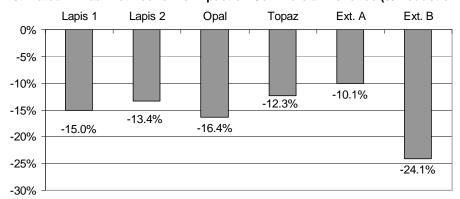

DRAFT - 17 June 2009

² For an explanation of why net economic impact can exceed 100%, please see the Appendix.

Table 1: Highest/Lowest Annual Estimated Net Economic Impact on Commercial Fisheries by Port³

Port	MPA Proposal(s) with highest potential impact	MPA Proposal(s) with lowest potential impact
Santa Barbara	Topaz	Ext. B
Ventura	Ext. B	Ext. A
Port Hueneme	Ext. B	Ext. A
San Pedro	Ext. B	Ext. A
Dana Point	Ext. B	Ext. A
Oceanside	Opal	Ext. B
San Diego	Lapis 1	Ext. B
Study Region	Ext. B	Ext. A

Figure 1: Estimated Annual Net Economic Impact on Commercial Fisheries (% Reduction in Profit)

³ For all economic impacts, the results are the estimated maximum potential economic impact on average annual net revenue from 2000-07 (in \$2007).

⁵ Santa Barbara Ca. Halibut (Trawl) and Sea Cucumber (Trawl) are not included in this total. Please see Table 3 for estimated impacts on these two fisheries.

3.3 Potential Gross Economic Impacts on Commercial Fisheries

A key assumption of our analysis is that each of the MPA proposals completely eliminates fishing opportunities in areas closed to specific fisheries and that fishermen are unable to adjust or mitigate in any way. In other words, the analysis assumes that all fishing in an area affected by an MPA is lost completely, when in reality it is more likely that fishermen will shift their efforts areas outside the MPA. The effect of such an assumption is most likely an overestimation of the impacts, or a "worst case scenario."

Unlike net economic impact, gross economic impact does not account for fishermen's operating costs. Therefore, the percentage reduction in gross economic revenue on SCSR commercial fisheries considered is less than the percentage reduction in net economic revenue; however, the dollar reduction in gross economic revenue is greater than the dollar reduction in net economic revenue. Figures 3–4 compare the potential annual gross economic impact with the potential net economic impact on SCSR commercial fisheries considered.

On average, Ext. A is estimated to have the lowest potential gross economic impact across the study region, while Ext. B is estimated to have the highest potential impact.

The potential gross economic impacts from each proposal are broken down by port in Figure 5 and Table 11. On average, Santa Barbara is the port estimated to see the lowest potential gross economic impacts (as a %), while San Diego is estimated to see the highest potential gross economic impacts (as a %). Tables 12–19 show potential impacts by fishery for each port and for the SCSR.

In terms of <u>potential gross economic impact</u> across the SCSR for the top six commercial species (based on % contribution to overall SCSR ex-vessel values), several patterns emerge from the analysis of the six proposals:

- The rock crab fishery sees the lowest range of potential impacts (in dollars). Topaz has the highest potential impact on the rock crab fishery (\$112,056), while Ext. B has the lowest potential impact (\$76,933).
- The squid fishery sees the highest range of potential impacts (in dollars). Ext. B has the highest potential impact on the squid fishery (\$4,883,361), while Ext. A has the lowest potential impact (\$1,127,240).
- The rock crab fishery sees the lowest range of potential impacts (as a %). Topaz has the highest potential impact on the rock crab fishery (7.6%), while Ext. B has the lowest potential impact (5.2%).
- The spot prawn fishery sees the highest range of potential impacts (as a %). Ext. B has the highest potential impact on the spot prawn fishery (27.9%), while Ext. A has the lowest potential impact (11.1%).

⁷ Santa Barbara Ca. Halibut (Trawl) and Sea Cucumber (Trawl) are not included in this total. Please see Table 12 for estimated impacts on these two fisheries.

DRAFT – 17 June 2009

4. Results for Commercial Passenger Fishing Vessels (CPFV)

We summarize here our analyses of the potential impacts on the 10 CPFV fisheries (i.e., Barracuda, Ca. Halibut, Calico Bass, Lingcod, Rockfish, Ca. Scorpionfish, Ca. Sheephead, Sand Bass, Whitefish, and White Seabass). The results for CPFV fisheries are broken out by study region and by port (i.e., Santa Barbara, Port Hueneme/Channel Islands Harbor, Santa Monica, San Pedro/Long Beach, Newport Beach, Dana Point, Oceanside, and San Diego).

4.1 Potential Impacts on CPFV Fishing Grounds (Area and Value)

MPA proposals vary considerably in their effects, both between and across fisheries. As mentioned previously, this report only presents results. Evaluation methods are presented in a separate document. Each proposal affects the CPFV fisheries differently. For information on the potential impacts on CPFV fishing grounds for the 80 port-fishery combinations considered in this analysis (both in terms of total area and total value), please see Tables A.3 and A.4 in the Appendix.

4.2 Potential Economic Impacts on CPFV Fisheries

Table 20 summarizes the MPA proposals with the estimated highest and lowest potential economic impact by port (for associated values, see Table 21). On average, Ext. A is estimated to have the lowest potential net economic impact across the study region, while Lapis 1 is estimated to have the highest potential impact.

Figure 6 summarizes the potential annual net economic impact on all SCSR CPFV fisheries considered. Similar to our analysis of the commercial fisheries, we calculate the potential net economic impact for the CPFV fisheries as the average (i.e., for all 10 species considered) percentage reduction on net economic revenue (i.e., profit). On average, San Pedro/Long Beach is the port estimated to see the lowest potential net economic impacts (as a %), while San Diego is estimated to see the highest potential impacts (as a %). The potential impacts from each proposal are further broken down by port in Figure 7.

Table 20: Highest/Lowest Annual Estimated Net Economic Impact on CPFV Fisheries by Port

Port	MPA Proposal(s) with highest potential impact	MPA Proposal(s) with lowest potential impact
Santa Barbara	Topaz	Ext. B
Port Hueneme / Channel Islands Harbor	Topaz	Lapis 2
Santa Monica	Lapis 1	Ext. B

5. Results for Recreational Fisheries

We summarize here our analyses of the potential impacts on the 17 recreational fisheries (i.e., Barracuda, Bonito, Ca. Halibut, Calico Bass, Croaker, Lobster, Mackerels, Rockfish, Rock Crab, Scallops, Sheephead, Sand Bass, Squid, Surf Perch, Thresher Shark, White Seabass, and Yellowtail). The results for recreational fisheries are broken out by user group (i.e., dive, kayak, and private vessel) and by county (i.e., Santa Barbara, Ventura, Los Angeles, Orange, and San Diego).

5.1 Potential Impacts on Recreational Fishing Grounds (Area and Value)

MPA proposals vary considerably in their effects, both between and across fisheries. Each proposal affects the recreational fisheries differently. Due to the large number of fisheries, user groups, and counties considered, we present potential impacts on total recreational fishing grounds (both in terms of total area and total value) in Tables A.5–A.18 in the Appendix.

Appendix A: Summary Tables of Potential Impacts

Example of Why Potential Impact on Profit (as a %) Can Exceed 100%

Cases where the potential net economic impact of a given MPA proposal on a commercial fishery exceeds 100% are not mistakes. Rather, they are directly related to how we account for operating costs.

In an effort to alleviate concerns over why potential impact can exceed 100%, we provide the following example.

The potential impact of a given MPA proposal is the impact to the baseline gross economic revenue (BGER), also know as ex-vessel landing value for the fishery. Assume a hypothetical fishery for which BGER is \$196,774 and a given MPA proposal that has a 58% impact on that fishery. To estimate gross economic impact (GEI), we multiply BGER * 58%, which equals \$114,207. Then we calculate the potential gross economic revenue (GER) if the MPA proposal went into effect by subtracting the GEI from BGER. In this case, GER = BGER - GEI = \$82,566.

To determine net economic revenue (NER) (i.e., profit) prior to the MPA, we consider fishermen's costs. The total estimated cost for this hypothetical fishery is 66% of BGER, or 66% * \$196,774 = \$130,362. NER is calculated as BGER minus estimated costs, or \$196,774 - \$130,362 = \$66,412.

To determine NER (i.e., profit) post impact, we consider how the MPA proposal will affect fishermen's costs. Total costs are equal to fixed costs + variable costs. Fixed costs⁸, which are calculated as a percentage of BGER, will not change. In this case, fixed costs are 42% of BGER, or 42% * \$196,774 = \$83,457.

However, the MPA proposal will affect fishermen's variable costs because fishermen will no longer be able to fish in certain areas. Variable costs are broken out by crew (11%) and fuel (13%) and are based on GER after considering the impact of the MPA. In this case, variable costs = fuel (11% * \$82,566) + crew (13% * \$82,566) = \$19,682.

Therefore, NER (i.e., profit) after the MPA proposal = GER - fixed costs - variable costs = \$82,566 - \$83,457 - \$19,683 = -\$20,572.

Net economic impact (NEI) after the MPA proposal (i.e., change in profit) is calculated as BNER - NER. In this case, \$66,411 - (-\$20,572) = \$86,983. Finally, to estimate the % NEI we divide NEI by BNER, or \$86,983 / \$66,412 = 130.9%. Because fishermen are likely to incur fixed costs regardless of the MPA proposal, the impact of the MPA on fishermen's profit exceeds 100%.

For additional details, please see Section 12 of the SAT Draft Methods Used to Evaluate Marine Protected Area Proposals for the MLPA South Coast Region.

DRAFT - 17 June 2009

⁸ We assume fixed costs to be anything other than crew and fuel (a bit of a simplifying assumption, but generally appropriate). Examples of fixed costs could be payment on a boat, docking/mooring fees, permit fees, gear costs, etc.
